

# Fly trap Jumbo

EnviroSafe  
products

## Directions for use

- 1 Open trap and remove sachet of bait provided. Open the sachet, then pour contents into the trap. The contents will dissolve in water.
- 2 Add approximately 600ml of water. For best results add warm water (not hot) to speed up the activation process. Swirl water in the trap to help dissolve the attractant.

**IMPORTANT: Check regularly and maintain water level. Do not allow it to dry out.**

- 3 For best results set the trap in sunny or bright areas, preferably where there is less wind. For optimum performance the trap should be placed no more than 45cm from the ground, as flies search low for food.
- 4 Attractant requires an activation period of generally 24 - 48 hours before it becomes fully effective. The outside temperature may have some bearing on this time. Flies remain dormant until their body temperature reaches approximately 18°C.
- 5 Over time, an odour will develop as trapped flies accumulate. Discard the flies when necessary or at least every 2 - 3 weeks.
- 6 For best results use only EnviroSafe Fly Catcher Replacement Attractant - 12gram. To reset the trap, repeat steps 1 - 4.

**NOTE: Always wash hands thoroughly after carrying out any Fly trap maintenance.**

## The facts about this system

- Revolutionary** Not just a little better.
- Economical** Engineered for low cost and reuse.
- Effective** Out-catches other systems tested by several fold - results guaranteed.
- Scientific** Exclusive Patent Pending attractant and trap.
- Safe** The attractant is a non-toxic, pesticide free product made from Food Grade ingredients.
- Easy to use** Just add water!
- Multi-species** The system catches a broad range of fly species, including house and blow flies.

The EnviroSafe™ Fly Trap and attractant system is the result of years of intensive research to determine the most cost-effective and easy to use method of catching flies. The resulting design sets a new standard in fly catching, representing the best value for money product on the market today.

## A variety of outdoor applications

- Household
- Dairies
- Cattle yards
- Stables
- Poultry
- Sheep stations
- Packing sheds
- Pet kennels
- Barbeque areas

**CAUTION: KEEP OUT OF REACH OF CHILDREN**

## Why catch flies?

- Flies are unsanitary pests and a proven carrier of major diseases.
- Eliminating one female fly can reduce populations in the area by up to 500 flies per year.

## About the EnviroSafe system

Different fly species are attracted to different things. House flies like dairy and poultry waste as well as garbage. Blow flies are attracted only to decaying meat. Most will catch one or the other, but EnviroSafe will catch house flies, blow flies and a broad range of other species, making it a very unique attractant.

## Fly facts

- Flies remain dormant until their body temperature reaches 18°C.
- Flies search low, so traps are most effective when they are placed 45cm or less from ground level.
- Flies like heat, light and low wind, so place the traps in sunny areas.
- Even trapped flies will lay eggs, but the larve will not survive in water. Therefore it is important to add water above the level of trapped flies to kill the larvae.
- Flies can be attracted approximately 20 metres from traps.
