

RELAY
200g/L IMIDACLOPRID
GROUP 4A INSECTICIDE

Relay

200 SC TERMITICIDE

PRODUCT DESCRIPTION

Relay is a non-repellent, water based formulation containing 200g/L imidacloprid. It is a low odour cost effective soil termiticide which eliminates termites from structures and provides a long term soil barrier. It is formulated as a low volatile, highly effective Suspension Concentrate (SC) .

WHERE TO USE

Relay Termiticide is registered for the management of subterranean termites, including *Mastotermes darwiniensis* and *Coptotermes acinaciformis* and to prevent damage to existing buildings and structures. It can also be used for the protection of service posts and poles, to eliminate nests in wall cavities, poles and trees, in reticulation systems and in complete underslab installations. Relay is a dual action termiticide. It kills termites attempting to attack the structure and has the potential to be taken back to the nest where it kills the source of infestation.

FEATURES & BENEFITS

- *Highly effective non-repellent*
- *Dual protection kills termites attacking the structure along with the colony*
- *Cost effective*
- *Can be used to eliminate termite nests*
- *Provides at least 5 years long term protection*
- *Non-volatile, water based formulation ensuring easy mixing and low odour*
- *A unique 3.5L Tilt and Measure bottle that is easy and accurate to use*
- *FMC quality assured*
- *Eligible for FMC's Eflex warranty ensuring homeowner peace of mind*

HOW TO USE

Product can be applied using a conventional spray or foam to eliminate termite nests. Additionally, a barrier can be created using a combination of conventional spraying, reticulation, trenching along with soil rodding and drill and injecting through concrete. Refer to the label for application instructions.

DIRECTIONS FOR USE RESTRAINTS

- DO NOT apply to excessively wet soils, immediately after or during heavy rain, to avoid runoff.
- DO NOT disturb the treated soil barrier with subsequent construction of additions or alterations, paths, steps, flower beds etc.
- DO NOT apply at less than indicated label rates.
- DO NOT use in cavity walls except for direct treatment of a nest.

SITUATIONS	ALL AREAS EXCEPT TASMANIA		
	PEST	RATE	CRITICAL COMMENTS
Existing Buildings Barrier treatments for existing buildings including domestic, industrial, government and commercial premises. Also applicable to external barriers (only) around new buildings	Subterranean termites except <i>Mastotermes darwiniensis</i>	250mL in 100L water	(See also <i>GENERAL INSTRUCTIONS</i>) Mix the required quantity of Relay 200 SC Termiticide in water and apply using suitable application equipment to form a complete and continuous barrier around and under the structure. The barrier may be created using a combination of conventional spraying and trenching along with soil rodding. Concrete foundation slabs and paths around the structure should be drilled and injected with Relay 200SC Termiticide solution, including along the expansion joints and cracks. In some cases the use of wetting agents or foaming agents may be useful in overcoming non-wetting soils or getting a more even application in areas of difficult access or soil subsidence. If the barrier is disturbed by earthworks, construction or severe drainage problems, it will have to be restored by reapplication.
	<i>Mastotermes darwiniensis</i>	500mL in 100L water	
Service Poles and Posts	Subterranean termites except <i>Mastotermes darwiniensis</i>	250mL in 100L water	For new posts treat the bottom of the hole and back-fill using a minimum of 10L of solution per hole. For existing posts create a continuous treated zone 150mm wide by soil rodding or spraying the back-filled soil to a depth of 450mm. Note: It is impossible to treat the soil at the bottom of a sound post so future attack via this route cannot be ruled out.
	<i>Mastotermes darwiniensis</i>	500mL in 100L water	
Nests in wall cavities, poles and trees	Subterranean termites except <i>Mastotermes darwiniensis</i>	250mL in 100L water	Locate nest by drilling holes into the wall, tree or pole. Make sure that the full size of the nest is identified especially the highest point. Apply at least 20L of Relay 200SC Termiticide solution into the nest through the drill holes. Drill holes should be sealed after application. Note: Application to wall cavities behind plaster board may result in water/mud staining of the board. Using a dry foam applicator can reduce the risk and improve the distribution within the wall cavity.
	<i>Mastotermes darwiniensis</i>	500 mL in 100L water	
Reticulation Systems Perimeter and/or service penetration treatment Complete under slab installations	Subterranean termites except <i>Mastotermes darwiniensis</i>	250mL in 100L water	The system (refer to the <i>GENERAL INSTRUCTIONS</i>) must be installed to the manufacturer's specifications. The system installer use must ensure that the installation will result in the application of not less than 250mL (500mL for <i>Mastotermes darwiniensis</i>) of product per m ² of soil, applied in a continuous treated zone not less than 100mm thick. The volume of soil treated and diluted solution applied by a system is dependent on the parameters of the particular system and the type of soil present respectively. Guidelines should be sought from the manufacturer. For a barrier with dimensions of 300mm deep x 150mm wide, 5L of spray solution per linear metre is suitable for perimeter and/or service penetration only systems. This will be different for systems treating a different volume of soil. For the horizontal barrier under a slab, not less than 50mL (100mL for <i>Mastotermes darwiniensis</i>) of product is required per m ² . In addition the system installer must also ensure that a prepared sand/soil bed of 100mm depth is provided across the whole of the under slab installation to ensure complete horizontal coverage of the product.
	<i>Mastotermes darwiniensis</i>	500mL in 100L water	

NOT TO BE USED FOR ANY PURPOSE OR IN ANY MANNER, CONTRARY TO THIS LABEL UNLESS AUTHORISED UNDER APPROPRIATE LEGISLATION.
